

13th International Conference

Ecology and Management of Alien Plant Invasions

Waikoloa, Hawai'i September 20-24, 2015

EMAPi Conferences (Ecology and Management of Alien Plant Invasions) uniquely focus on invasive plant research and management. They are held in alternate years at selected venues around the world.

EMAPi 2015 provides the opportunity to share findings and experiences — research, management, and policy — with professionals from around the world. A mid-conference field trip offers first-hand experience with Hawaii's plant invasions, while also allowing extensive opportunities for networking.

The Hawaiian Islands provide a premier venue for exploring invasive plant research and impacts, where changing land use patterns and climate, and many rare endemic species present a challenging context for plant invasion management and ecological restoration.
